- (54) Title: IMAGING SYSTEM AND METHOD FOR BODY CONDITION EVALUATION**

**(57) Abstract:** An imaging method and system are presented for use in automatic monitoring the body condition of an animal. A predetermined region of interest on the animal body is imaged, and data indicative of the acquired one or more images is processed to obtain a three-dimensional representation of the region of interest. The three-dimensional representation is analyzed to determine a predetermined measurable parameter indicative of a surface relief of the region of interest which is indicative of the body condition of the imaged animal. The technique of the present invention is useful for determining the energy balance condition of the animal (e.g., dairy cow) or the tendency in the energy balance change, to thereby enable appropriately adjusting nutrition of the specific animal; as well as for determining the existence of in coordination and/or locomotion in the animal's natural marching.

### IMPORTANT NOTIFICATION

International application No.  
PCT/IL 03/00622

International filing date (day/month/year)  
27.07.2003

Priority date (day/month/year)  
25.07.2002

Applicant  
VET-TECH LTD. et al.

1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.
4. **REMINDER**

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. **PCT/IL 03/00622**

**I. Basis of the report**

1. With regard to the **elements** of the international application (*Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17):*

**Description, Pages**

1-23 as originally filed

**Claims, Numbers**

1-41 as originally filed

**Drawings, Sheets**

1/6-6/6 as originally filed

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).
- ☐ the language of publication of the international application (under Rule 48.3(b)).
- ☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:
- ☐ the drawings, sheets:

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. **PCT/IL 03/00622**

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)).

*(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)*

6. Additional observations, if necessary:

**V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

**1. Statement**

Novelty (N)	Yes: Claims	1-41
	No: Claims	
Inventive step (IS)	Yes: Claims	1-41
	No: Claims	
Industrial applicability (IA)	Yes: Claims	1-41
	No: Claims	

**2. Citations and explanations**

**see separate sheet**

1. Reference is made to the following documents:

D1: US-B-6 377 3531 (Ellis) 23 April 2002  
D2: US-A-5 483 441 (Scofield) 9 January 1996  
D3: US-B-6 234 1091 (Andersson et al.) 22 May 2001

2. **Item V: Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

2.1 The present application meets the requirements of Articles 33(2) and 33(3) PCT because the subject matter of claims 1, 2 and 22-24 is novel and involves an inventive step, the reasons being as follows:

As to claim 1:

D1 discloses:

- An imaging method for use in automatic monitoring the body condition of an animal (see abstract, lines 1-11), the method comprising:
- I) imaging a predetermined region of interest on the animal body, and generating data indicative thereof (see abstract, lines 1-11);

D1 however fails to disclose:

- ii) processing the generated data to obtain a three-dimensional representation of the region of interest;
- iii) analyzing said three-dimensional representation to determine a predetermined measurable parameter indicative of a surface relief of the region of interest indicative of the body condition.

D1 merely discloses a method for volumetric measurement of an animal by projecting a light spot pattern onto the animal and determining the vertical, horizontal and depth dimension for each projected point.

Although D1 determines a 3D model for the volumetric measurement, no surface relief parameter is determined from the 3D model. D1 therefore fails to disclose feature ii) and iii) of present claim 1.

D2, cited in the application, discloses an animal evaluation device taking images

from two fields of view through which the animal moves, thereby forming the difference image from which parameters are determined.

D2 does not involve 3D modelling of the region of interest and no surface relief determination therefrom. Thus, D2 fails to disclose feature I)-iii) of claim 1.

D3, cited in the application, discloses a device for determining the position of the teats of a cow to guide an automatic milking device. D3 also involves structured light to measure the 3D position of the teats, but also fails to disclose features ii) and iii) of claim 1, namely that a surface relief parameter indicative of a body condition of the animal is determined from said 3D model.

An inventive step can be acknowledged.

As to claim 2:

D1 discloses:

- A method for optimizing nutrition of an animal, the method comprising automatically monitoring the energy balance of the animal (see abstract, lines 1-11), said monitoring comprising:
  - I) imaging a predetermined region of interest on the animal body, and generating data indicative thereof (see abstract, lines 1-11);

D1 however fails to disclose:

- ii) processing the generated data to obtain a three-dimensional representation of the region of interest;
- iii) analyzing said three-dimensional representation to determine a predetermined measurable parameter indicative of a surface relief of the region of interest indicative of the energy condition of the animal.

Claim 2 meets the requirements of Articles 33(2) and 33(3) PCT for the same reasons as given for claim 1 above.

As to claim 22:

D1 discloses:

- A method for monitoring the condition of an animal (see abstract, lines 1-11).

D1 however does not disclose:

- (1) imaging the cow while marching along a predetermined path and generating

data indicative of the acquired images;

- (2) analyzing said data to identify the existence of a certain pattern of locomotion or in-coordination in the cow's marching, said pattern being indicative of the existence of neurological disorders associated with nervous system diseases of the animal.

Feature (1) can be found in document D2 (see figure 1a). However, none of the available documents of the prior art discloses feature (2).

An inventive step can be acknowledged.

As to claim 23:

D1 discloses:

- An imaging method for use in automatic monitoring the body condition score (BCS) of a dairy cow (see abstract, lines 1-11).

D1 however fails to disclose:

- imaging a first region of interest on the cow's body in the vicinity of the transverse processes of the lumbar vertebrae and the spinous processes of the lumbar vertebrae of the cow, and a second region of interest on the cow's body in the vicinity of its tail part, and generating imaged data;
- processing the imaged data to obtain a three-dimensional representation of the first region of interest and the second region of interest;
- analyzing the three-dimensional representation to determine a predetermined measurable parameter indicative of a surface relief of the region of interest, thereby determining first and second BCS values for the first and second regions of interest, respectively, a difference between the first and second BCS values being indicative of a tendency in the cow energy balance condition.

None of these features are disclosed in any of the available prior art.

An inventive step can be acknowledged.

As to claim 24:

D1 discloses:

- A system for monitoring the body condition of an animal (see abstract, lines 1-11), the system comprising:
- (a) an optical device including an illuminating assembly operable to produce structured light in the form of an array of spatially separated light components to thereby illuminate an array of locations within a predetermined region of interest on a body part of the animal, and a light detection assembly operable for acquiring at least one image of the illuminated body part by collecting light scattered therefrom and generating data indicative of the acquired image (see abstract, lines 1-11 and figure 1);

D1 does not disclose:

- (b) a control unit connectable to the optical device, the control unit comprising a memory utility for storing reference data representative of the body condition scales and corresponding values of a predetermined measurable parameter that is indicative of the curvature of the predetermined region of interest; and a data processing and analyzing utility preprogrammed for processing the data indicative of the acquired image to calculate a value of the measurable parameter for the specific imaged animal, and analyze the calculated value with respect to the reference data to thereby determine the body condition scale of the specific animal.

D1 merely discloses a method for volumetric measurement of an animal by projecting a light spot pattern onto the animal and determining the vertical, horizontal and depth dimension for each projected point.

Although D1 determines a 3D model for the volumetric measurement, no curvature is determined. D1 therefore fails to disclose feature b) of present claim 24.

Feature b) is further not disclosed by any of the available prior art.

An inventive step can be acknowledged.

- 2.3 The independent claims are not in the two-part form in accordance with Rule 6.3(b) PCT, which in the present case would be appropriate, with those features known in combination from the prior art (document D1) being placed in the preamble (Rule 6.3(b)(I) PCT) and with the remaining features being included in the characterising part (Rule 6.3(b)(ii) PCT).

The independent claims should therefore be redrafted accordingly. If, however, the applicant is of the opinion that the two-part form would be inappropriate, then reasons therefor should be provided in the letter of reply. In addition, the applicant should ensure that it is clear from the description which features of the subject-matter of the claims are already known in combination from the document D1 (see the PCT Guidelines, III-2.3a).

- 2.4 The features of the claims are not provided with reference signs placed in parentheses (Rule 6.2(b) PCT).
- 2.5 Contrary to the requirements of Rule 5.1(a)(ii) PCT, the relevant background art disclosed in the document D1 is not mentioned in the description, nor is this document identified therein.
